Van stock: user guide

Each salesperson's van is its own store. The office store and every van have their own stock.

When	Who	In the app	Office store	Van	In Tally
Morning	Office admin	Home > **Issue to Van**	goes down	goes up	Stock Journal: office godown → van godown
During the day	Salesperson	**New Invoice** (as usual)	no change	goes down	Sales voucher from the van godown
End of day	Office admin	Home > **Return from Van** > **Return everything in the van**	goes up	back to 0	Stock Journal: van godown → office godown

Example: the office has 1,500. It issues 300 to Ajay, 200 to Ben and 500 to Chris, so the office store shows 500. Ajay sells 250 from the van, so Ajay's van shows 50 and the office store still shows 500. In the evening Ajay returns 50, so the van shows 0 and the office store shows 550.

One-time setup

1. **TallyPrime:** F11 Features > Inventory > **Maintain multiple godowns: Yes**. Create a godown for each van (Gateway of Tally > Create > Godown), for example `Van 1`, `Van 2`. The office store is Tally's **Main Location** unless you use another godown for it.
2. **Office PC:** the connector must be version **0.3.0** or later (office setup package v1.3). Run `check.cmd` to see the version. See SETUP.md, "Upgrading".
3. **App (office admin):** More > **Van stock**:
   - tick **Use van stock**;
   - **Office store godown in Tally**: usually `Main Location`;
   - **+ Add van** for each van: a name (for example `Van 1 (A 12345)`), the **godown name exactly as in Tally**, and the **salesperson**;
   - **Save for all users**. Phones get it at their next sync.

A salesperson sells from one van. To give a van to someone else (leave, new joiner), change its salesperson; the stock stays with the van. A van with stock in it cannot be removed; return its stock first.

Daily use

Morning (office): Home > **Issue to Van** > choose the van > **+ Add item** for each item and enter the quantity > **Save**. Each line shows the office store stock. Print or share the issue note for the driver to sign.

During the day (salesperson): make invoices as usual. The home screen says "You sell from Van 1". Each item shows how many are in the van. The app does not save an invoice for more than the van holds. If the office has just loaded the van, tap **Sync now** first so the phone knows.

End of day (office): Home > **Return from Van** > choose the van > **Return everything in the van** (fills in all items left) > correct any quantity that did not come back (damaged or missing) > **Save**.

Every van must be returned at the end of the day. A van that still has stock from an earlier day is flagged on the home screen and on **Van stock**.

Van stock screen

Home > **Van stock** (office admin) shows each van's items and the **office store**. A salesperson sees **My van stock**.

Office store = Tally's total stock − stock in vans − van sales not yet posted in Tally. Tally's figures are as of the last sync.

Office sales

When the office admin makes an invoice, **Sell from** chooses **Office store** (the default) or a van.

If something fails

- "Godown 'Van 1' does not exist" in the sync check: the godown name in More > Van stock does not match Tally, or the godown was not created. Fix the name or create the godown, then tap **Retry now** on the entry.
- Van entries **Failed** right after switching on: the office PC still runs an older connector. Install office setup v1.3, then retry.

Office PC: upgrading an existing installation (for example to van stock, connector 0.3.0)

Do these in order. Each step is safe to repeat.

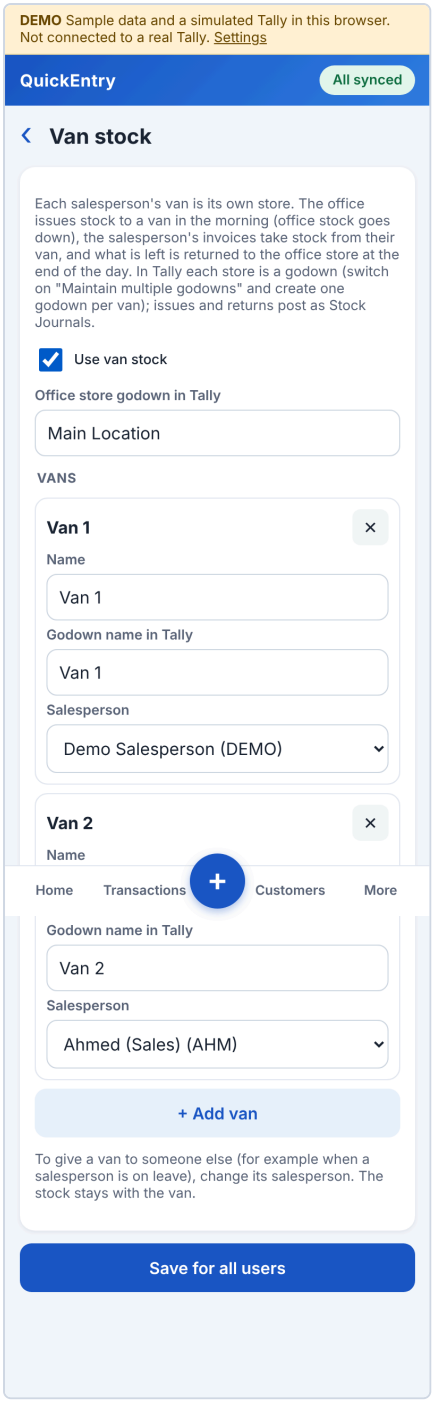

1. **Database (Supabase):** SQL Editor, paste all of the new `relay/supabase/schema.sql`, run. It only adds what is missing (for van stock: the `van_moves` table and the `stock.vans` operation); existing data stays.
2. **App and API (Cloudflare):** merge the change to `main`. Workers Builds deploys it in about a minute. Phones pick up the new app the next time it is opened (an entry being typed is not interrupted).
3. **Office PC:** copy the new office setup package (`QuickEntry-Office-Setup-v1.3.zip`) to the PC, unzip it, open `connector\windows` and double-click `install.cmd`. It upgrades the program files and keeps the company name, address and connector key. Then run `check.cmd`: the first line must say **version 0.3.0** and every line **OK**.
4. **New features that need switching on** (van stock): set up Tally first (section 5a), then switch the feature on in the app.

An older connector cannot post van issues or returns: they show as **Failed** in the sync check. Update the office PC before switching van stock on. Failed entries are retried automatically for a few hours; after that, open the entry and tap **Retry now**.

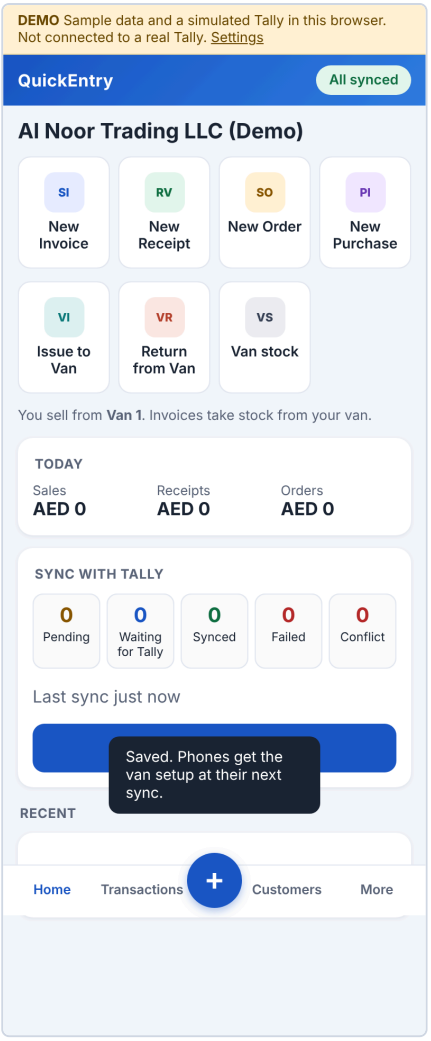

Moving the connector to a different office PC

1. On the old PC: `C:\Program Files\QuickEntry\uninstall.cmd` (stops the background task).
2. On the new PC: install TallyPrime with the same company, load `tdl\QuickEntry.tdl` (section 3), then run `install.cmd` from the latest office package. Enter the same company name and app address. For the key, use the company's connector key; if it is not at hand, create a new one in the owner screen (`/owner.html` > the company > **New connector key**), which also stops the old PC's key.
3. Run `check.cmd`. Nothing is lost by the move: entries wait on the server until the new PC posts them, and the connector's sync position is stored on the server, not on the PC.
